

SIMULATED PHISHING

✓ Extend your training toolbox

Simulated phishing involves sending a safe but supposedly malicious email to your colleagues, using the same tricks as a cybercriminal.

✓ Show, don't tell

People will no longer be able to say «this would never happen to us», since someone were indeed tricked by the simulation (this always happens).

✓ Facilitate «teachable moments»

The first hand experience of (almost) being tricked is very memorable. Create positive and lasting behavior change with actionable advice.

This was fun! :)

Great reminder of how easy it is to be fooled...

Awesome test, this one really exposed my naiveness

I would surely have been tricked, had it not been for our previous training!

- ✔ Simulate threats from real samples
- ✔ Gamification and personal progress
- ✔ Automated training with playbooks
- ✔ Randomize sending over time
- ✔ Pre-made templates to choose from
- ✔ Customize or create from scratch
- ✔ Fully managed domains and gateway
- ✔ SMS phishing option (standalone/dual)
- ✔ Multi-language support
- ✔ Dynamic user targeting based on history
- ✔ API for unlimited customization
- ✔ Azure AD user sync available
- ✔ Advanced statistics and data export
- ✔ Training portal and MailRisk integration
- ✔ EU-based and GDPR compliant

Instant feedback with MailRisk

Combine the phishing simulator with the MailRisk button for Outlook, for a uniquely positive end-user experience.

MailRisk will instantly reward users with points and a confirmation that the simulation was correctly spotted.

Create a long term positive outcome by training your colleagues in desired behavior – to click the MailRisk button for any suspicious email they receive.

Your colleagues will love MailRisk!
